Nytka Sviatoslav
Degree Master, post-graduate student
West Ukrainian National University, Ternopil, Ukraine

Problems of the old model of health care financing

Catastrophic financial insecurity of patients

Inefficient spending of budget funds

Low quality and efficiency of service provision

Electronic health care system

- The new system of procurement of medical services is accompanied by the creation and continuous improvement of a modern platform for the collection and exchange of medical and financial information in electronic form.
- The e-Health electronic system helps to implement the principle of "money follows the patient", as well as to analyze the state of health of the population in order to quickly develop an optimal plan for the purchase of medical services and spend money as efficiently as possible.

Primary health care (PHC) has been a priority for health care reform. The organization and provision of PMD services is based on the principles:

- Availability
- Security
- Effectiveness
- Economic efficiency
- Non-discrimination
- Human orientation

Національна служба здоров'я України

The function of purchasing qualitative and safe medical services needed by patients is performed by the National Health Service of Ukraine (NHSU)

OFFERS

- In the logistics of primary care financing reform, replace the “money follows the patient” principle with “money follows services”. This thesis highlights the basic model of the reform - the purchase of medical services by the state for the population.
- Establish an effective system of monitoring not the quantity and types of medical services provided through e-Health, but the quality of medical services through the creation of a system of indicators of the quality of primary health care.
